

## A Look At The Considerable Benefits Of Automatic Forex Trading

An increasing number of people are being attracted by Forex trading rather than to the many other types of investment and it is easy to see why this is the case.

The Forex market is the largest trading market in the world with a growing trading volume that has risen from in the region of \$500 billion dollars in 1989 to \$2 trillion today. It is also an amazingly liquid market that is not bound to any particular trading floor and operates around the clock across the world making it effectively a continuously open market. As one particular market closes another is opening for trading and you can follow the markets across the world as you trade and virtually eliminate the fact that your own home market is closed for the weekend.

As a result it is no wonder that Forex trading appeals to a wide variety of big and small traders each of whom enjoys a wide choice of trading strategies resulting from the myriad of factors that affect foreign currency rates. Indeed for many novice traders entering the market it is the many different things which affect foreign currency exchange rates that they find most attractive as it allow them to use a very large range of different tools when working in this amazingly exciting market.

Perhaps the largest influence today however on the future growth of the market and on its popularity lies in automation which has never been simpler to achieve and which brings with it many more advantages than disadvantages.

Automated Forex trading allows trades to be conducted in real time anywhere in the world and virtually eliminates the losses so often seen in manual systems that are operating in such a fast moving and volatile environment. Anybody who has traded with a manual system knows only too well the aggravation resulting from a row of trading losses caused by nothing more than a time delay in selling or buying.

Automated trading also brings with it the ability to trade in a number of different currency markets simultaneously without any regard for the time zones of the particular markets in question. If you are sitting in the US at 2 o'clock in the morning then automatic trading permits you to conduct business with traders on the other side of the globe in a variety of different countries all at the same time without any problem.

For many traders one difficulty is the management of risk and this risk is also reduced as we move towards automatic trading. Manual trading systems often leave traders anxious about whether or not payment will be made after the conclusion of a trade but because payments can now be synchronized in real time this is a lot less likely. Indeed, as automated trading systems continue to develop it is clear that settlement systems will also be developed and any risks will probably be almost eliminated in the near future.

Computer technology has advanced by leaps and bounds over the past few years and is going to continue to advance in the years ahead. More importantly, access to computer technology easily and inexpensively from the comfort of our own homes, or today even while we are traveling, means that we are now all able to manage our investments easily. For people working in the currency trading world automated currency trading will undoubtedly be a welcome addition to an already excellent form of investment.
